ABSTRACT:

The Online Buyers Club System (OBCS) is a mechanism for the online purchasing of goods and services. The mechanism is targeted at user communities consisting of a large number of small-volume buyers (the "Buyers Club"). The primary function of the mechanism is to automatically aggregate the buying power of these buyers. The present invention provides a mechanism to promote competition among vendors as well as a mechanism to incent buyers to make a purchase.

TITLE: Facilitator for aggregating buyer power in an on-line market system

Detailed Description Text (10):

SellCo may also wish to have its prices depend on other factors, such as the rate at which buy offers are coming in. In this case, SellCo may be able to change its schedule. An automated means of doing this is called an automated strategy. Note that the special case of a fixed price schedule with a complicated automated strategy is the same as permitting the schedule to depend on more factors than just quantity.

Detailed Description Text (32):

If a buyer can submit a bid that is for either X or Y depending on price, the situation gets complicated. Essentially, bidders get put into either the queue expected to buy X or the queue expected to buy Y. As the relative prices change, bidders move from one queue to the other. This is called "Switching Goods". This is the same for the original mechanism or for the pure declining posted price mechanism. The quantities and prices of the sale are determined by the quantities in each queue at the end of the auction. (See Switching Goods and Final Quantity Schedules.)
